7.6 Partial derivatives and continuity

Example 28 Let

f continuous $\nRightarrow f$ cont

$$f(\Delta x, 0) = 0$$

$$f(0, \Delta y) = 0$$

$$f(x, y) = \begin{cases} -\frac{xy}{x^2 + y^2}, & (x, y) \neq (0, 0) \\ 0, & (x, y) = (0, 0) \end{cases}$$

(a) Show that $f_x(x, y)$ and $f_y(x, y)$ exist at all points (x, y) .

(b) Explain why f is not continuous at $(0, 0)$.

(a) $f_x(x, y)$ exists at $(x, y) \neq (0, 0)$

$$f_x(x, y) = -\frac{(x^2 + y^2)y - xy(2x)}{(x^2 + y^2)^2}$$

$$f_y(x, y) = -\frac{(x^2 + y^2)x - xy(2y)}{(x^2 + y^2)^2}$$

(b) $f_x(0, 0)$ exists at $(x, y) = (0, 0)$

$$f_x(0, 0) = \lim_{\Delta x \rightarrow 0} \frac{f(0 + \Delta x, 0) - f(0, 0)}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{0 - 0}{\Delta x} = 0$$

$$f_y(0, 0) = \lim_{\Delta y \rightarrow 0} \frac{f(0, 0 + \Delta y) - f(0, 0)}{\Delta y} = \lim_{\Delta y \rightarrow 0} \frac{0 - 0}{\Delta y} = 0$$

$$\therefore f_x(x, y) = \begin{cases} -\frac{(x^2 + y^2)y - 2x^2y}{(x^2 + y^2)^2}, & (x, y) \neq (0, 0) \\ 0, & (x, y) = (0, 0) \end{cases}$$

$$f_y(x, y) = \begin{cases} -\frac{(x^2 + y^2)x - 2xy^2}{(x^2 + y^2)^2}, & (x, y) \neq (0, 0) \\ 0, & (x, y) = (0, 0) \end{cases}$$

$$(b) \quad \text{① } f(0, 0) = 0$$

$$\text{② } \lim_{(x, y) \rightarrow (0, 0)} f(x, y) \text{ DNE}$$

7.7 Partial derivatives of functions with more than two variables $\therefore f$ is not continuous at $(0, 0)$

For a function $f(x, y, z)$ of three variables, there are three **partial derivatives**:

$$f_x(x, y, z), \quad f_y(x, y, z), \quad f_z(x, y, z)$$

The partial derivative f_x is calculated by holding y and z constant and differentiating with respect to x .

For f_y the variables x and z are held constant, and for f_z the variables x and y are held constant. If a dependent variable

$$w = f(x, y, z)$$

is used, then the three partial derivatives of f can be denoted by

$$\frac{\partial w}{\partial x}, \quad \frac{\partial w}{\partial y} \quad \text{and} \quad \frac{\partial w}{\partial z}$$

Example 29 Let $f(x, y, z) = x \sin(y + 3z)$. Find f_x , f_y and f_z .

$$f_x = \sin(y + 3z)$$

$$f_y = x \cos(y + 3z) \frac{\partial}{\partial y}(y + 3z) = x \cos(y + 3z)$$

$$f_z = x \cos(y + 3z) \frac{\partial}{\partial z}(y + 3z) = 3x \cos(y + 3z)$$

Example 30 If $f(x, y, z) = x^3 y^2 z^4 + 2xy + z$, then

$$f_x(x, y, z) = 3x^2 y^2 z^4 + 2y$$

$$f_y(x, y, z) = 2x^3 y z^4 + 2x$$

$$f_z(x, y, z) = 4x^3 y^2 z^3 + 1$$

$$f_z(-1, 1, 2) = 4(-1)^3 (1)^2 (2)^3 + 1 = -31$$

Example 31 If $f(\rho, \theta, \phi) = \rho^2 \cos \phi \sin \theta$, then

$$f_\rho(\rho, \theta, \phi) = 2\rho \cos \phi \sin \theta$$

$$f_\theta(\rho, \theta, \phi) = \rho^2 \cos \phi \cos \theta$$

$$f_\phi(\rho, \theta, \phi) = \rho^2 (-\sin \phi) \sin \theta$$

In general, if $f(v_1, v_2, \dots, v_n)$ is a function of n variables, there are n partial derivatives of f , each of which is obtained by holding $n-1$ of the variables fixed and differentiating the function f with respect to the remaining variable. If $w = f(v_1, v_2, \dots, v_n)$, then these partial derivatives are denoted by

$$\frac{\partial w}{\partial v_1}, \quad \frac{\partial w}{\partial v_2}, \quad \dots, \quad \frac{\partial w}{\partial v_n}$$

where $\frac{\partial w}{\partial v_i}$ is obtained by holding all variables except v_i fixed and differentiating with respect to v_i .

7.8 Higher – order partial derivatives

Suppose that f is a function of two variables x and y . Since the partial derivatives $\partial f / \partial x$ and $\partial f / \partial y$ are also functions of x and y , these functions may themselves have partial derivatives. This gives rise to four possible **second-order partial derivatives** of f , which are defined by

$$\frac{\partial^2 f}{\partial x^2} = \frac{\partial}{\partial x} \left(\frac{\partial f}{\partial x} \right) = f_{xx}$$

Differentiate twice with respect to x .

$$\frac{\partial^2 f}{\partial y^2} = \frac{\partial}{\partial y} \left(\frac{\partial f}{\partial y} \right) = f_{yy}$$

Differentiate twice with respect to y .

$$\frac{\partial^2 f}{\partial y \partial x} = \frac{\partial}{\partial y} \left(\frac{\partial f}{\partial x} \right) = f_{xy}$$

Differentiate first with respect to x and then with respect to y .

$$\frac{\partial^2 f}{\partial x \partial y} = \frac{\partial}{\partial x} \left(\frac{\partial f}{\partial y} \right) = f_{yx}$$

Differentiate first with respect to y and then with respect to x .

mixed second-order partial derivative
 $f_{xy} = f_{yx}$

The last two cases are called the **mixed second-order partial derivatives** or the **mixed second**

partials. Also, the derivatives $\partial f / \partial x$ and $\partial f / \partial y$ are often called the **first-order partial derivatives**

when it is necessary to distinguish them from higher-order partial derivatives. Similar conventions apply to the second-order partial derivatives of a function of three variables.

Example 32 Find the second-order partial derivatives of $f(x, y) = x^2 y^3 + x^4 y$.

$$\left. \begin{aligned} f_x &= 2xy^3 + 4x^3y \\ f_y &= 3x^2y^2 + x^4 \end{aligned} \right\} \begin{aligned} f_{xx} &= 2y^3 + 12x^2y \\ f_{yy} &= 6x^2y \\ f_{xy} &= 6xy^2 + 4x^3 \\ f_{yx} &= 6xy^2 + 4x^3 \end{aligned}$$

Then $\partial f(x, y)$ and $\partial^2 f(x, y)$ are f_x, f_y, f_{xy}, f_{yx} and f_{xx}, f_{yy} at (a, b) and $f_{xy}(a, b) = f_{yx}(a, b)$

Third-order, fourth-order, and higher-order partial derivatives can be obtained by successive differentiation. Some possibilities are

$$\frac{\partial^3 f}{\partial x^3} = \frac{\partial}{\partial x} \left(\frac{\partial^2 f}{\partial x^2} \right) = f_{xxx}$$

$$\frac{\partial^4 f}{\partial y^4} = \frac{\partial}{\partial y} \left(\frac{\partial^3 f}{\partial y^3} \right) = f_{yyyy}$$

$$\frac{\partial^3 f}{\partial y^2 \partial x} = \frac{\partial}{\partial y} \left(\frac{\partial^2 f}{\partial y \partial x} \right) = f_{xyy}$$

$$\frac{\partial^4 f}{\partial y^2 \partial x^2} = \frac{\partial}{\partial y} \left(\frac{\partial^3 f}{\partial y \partial x^2} \right) = f_{xyxy}$$

Example 33 Let $f(x, y) = y^2 e^x + y$. Find f_{xyy} .

$$\begin{aligned} f_x &= y^2 e^x \\ \frac{\partial}{\partial y} \left(\frac{\partial f}{\partial x} \right) &= f_{xy} = 2ye^x \\ \frac{\partial^3 f}{\partial y^2 \partial x} &= f_{xyy} = 2e^x \end{aligned}$$

8. The Chain rule

8.1 Chain rules for derivatives

Theorem 3 (Chain rules for derivatives)

If $x = x(t)$ and $y = y(t)$ are differentiable at t , and if $z = f(x, y)$ is differentiable at the point $(x, y) = (x(t), y(t))$, then $z = f(x(t), y(t))$ is differentiable at t and

$$\frac{dz}{dt} = \frac{\partial z}{\partial x} \frac{dx}{dt} + \frac{\partial z}{\partial y} \frac{dy}{dt}$$

where the ordinary derivatives are evaluated at t and the partial derivatives are evaluated at (x, y) .

If each of the functions $x = x(t)$, $y = y(t)$, and $z = z(t)$ is differentiable at t , and if $w = f(x, y, z)$ is differentiable at the point $(x, y, z) = (x(t), y(t), z(t))$, then the function $w = f(x(t), y(t), z(t))$ is differentiable at t and

$$\frac{dw}{dt} = \frac{\partial w}{\partial x} \frac{dx}{dt} + \frac{\partial w}{\partial y} \frac{dy}{dt} + \frac{\partial w}{\partial z} \frac{dz}{dt}$$

where the ordinary derivatives are evaluated at t and the partial derivatives are evaluated at (x, y, z) .

Example 34 Suppose that $z = x^2y$, $x = t^2$, $y = t^3$. Use the chain rule to find $\frac{dz}{dt}$, and check the result

by expressing z as a function of t and differentiating directly.

Tree diagram for $z = x^2y$:
 $\frac{\partial z}{\partial x} \rightarrow x \rightarrow \frac{dx}{dt} = 2t$
 $\frac{\partial z}{\partial y} \rightarrow y \rightarrow \frac{dy}{dt} = 3t^2$

$$\begin{aligned} \frac{dz}{dt} &= \frac{\partial z}{\partial x} \cdot \frac{dx}{dt} + \frac{\partial z}{\partial y} \cdot \frac{dy}{dt} \\ &= (2xy) \cdot (2t) + (x^2) \cdot (3t^2) \\ &= 2 \cdot t^2 \cdot t^3 \cdot 2t + t^4 \cdot 3t^2 \\ &= 7t^6 \end{aligned}$$

$z = x^2y$; $x = t^2$, $y = t^3$

\downarrow

$z = (t^2)^2 \cdot t^3 = t^7$

$\frac{dz}{dt} = 7t^6$

Example 35 Suppose that $w = \sqrt{x^2 + y^2 + z^2}$, $x = \cos \theta$, $y = \sin \theta$, $z = \tan \theta$. Use the chain rule to

find $\frac{dw}{d\theta}$ when $\theta = \frac{\pi}{4}$.

Tree diagram for $w = \sqrt{x^2 + y^2 + z^2}$:
 $\frac{\partial w}{\partial x} \rightarrow x \rightarrow \frac{dx}{d\theta} = -\sin \theta$
 $\frac{\partial w}{\partial y} \rightarrow y \rightarrow \frac{dy}{d\theta} = \cos \theta$
 $\frac{\partial w}{\partial z} \rightarrow z \rightarrow \frac{dz}{d\theta} = \sec^2 \theta$

$$\begin{aligned} \frac{dw}{d\theta} &= \frac{\partial w}{\partial x} \frac{dx}{d\theta} + \frac{\partial w}{\partial y} \frac{dy}{d\theta} + \frac{\partial w}{\partial z} \frac{dz}{d\theta} \\ &= \frac{2x}{2\sqrt{x^2 + y^2 + z^2}} (-\sin \theta) + \frac{2y}{2\sqrt{x^2 + y^2 + z^2}} (\cos \theta) + \frac{2z}{2\sqrt{x^2 + y^2 + z^2}} \sec^2 \theta \\ &= \frac{\tan \theta \cdot \sec^2 \theta}{\sqrt{\sin^2 \theta + \cos^2 \theta + \tan^2 \theta}} = \frac{\tan \theta \cdot \sec^2 \theta}{\sqrt{1 + \tan^2 \theta}} \\ &= \frac{\tan \theta \cdot \sec^2 \theta}{\sec \theta} = \tan \theta \sec \theta \quad \text{and} \quad \frac{dw}{d\theta} \Big|_{\theta = \frac{\pi}{4}} = \sqrt{2} \neq \end{aligned}$$

$$y = f(u), \quad u = u(x), \quad x = x(t)$$

$$\text{or } \frac{dy}{dt} = \frac{dy}{du} \cdot \frac{du}{dx} \cdot \frac{dx}{dt}$$

$$z = f(x, y), \quad x = x(t), \quad y = y(t) \quad \text{or } \frac{dz}{dt}$$

$$\frac{dz}{dt} = \frac{\partial z}{\partial x} \cdot \frac{dx}{dt} + \frac{\partial z}{\partial y} \cdot \frac{dy}{dt}$$

$$w = f(x, y, z), \quad x = x(t), \quad y = y(t), \quad z = z(t) \quad \text{or } \frac{dw}{dt}$$

$$\frac{dw}{dt} = \frac{\partial w}{\partial x} \cdot \frac{dx}{dt} + \frac{\partial w}{\partial y} \cdot \frac{dy}{dt} + \frac{\partial w}{\partial z} \cdot \frac{dz}{dt}$$

$$z = f(x, y), \quad x = x(u, v), \quad y = y(u, v)$$

$$\frac{\partial z}{\partial u}, \quad \frac{\partial z}{\partial v}$$

$$\frac{\partial z}{\partial u} = \frac{\partial z}{\partial x} \cdot \frac{\partial x}{\partial u} + \frac{\partial z}{\partial y} \cdot \frac{\partial y}{\partial u}$$

$$\frac{\partial z}{\partial v} = \frac{\partial z}{\partial x} \cdot \frac{\partial x}{\partial v} + \frac{\partial z}{\partial y} \cdot \frac{\partial y}{\partial v}$$

$$w = f(x, y, z), \quad x = x(u, v), \quad y = y(u, v), \quad z = z(u, v)$$

$$\text{or } \frac{\partial w}{\partial u}, \quad \frac{\partial w}{\partial v}$$

$$\frac{\partial w}{\partial u} = \frac{\partial w}{\partial x} \cdot \frac{\partial x}{\partial u} + \frac{\partial w}{\partial y} \cdot \frac{\partial y}{\partial u} + \frac{\partial w}{\partial z} \cdot \frac{\partial z}{\partial u}$$

$$\frac{\partial w}{\partial v} = \frac{\partial w}{\partial x} \cdot \frac{\partial x}{\partial v} + \frac{\partial w}{\partial y} \cdot \frac{\partial y}{\partial v} + \frac{\partial w}{\partial z} \cdot \frac{\partial z}{\partial v}$$

8.2 Chain rules for partial derivatives

Theorem 4 (Chain rules for partial derivatives)

If $x = x(u, v)$ and $y = y(u, v)$ have first-order partial derivatives at the point (u, v) , and if $z = f(x, y)$ is differentiable at the point $(x, y) = (x(u, v), y(u, v))$, then $z = f(x(u, v), y(u, v))$ has first-order partial derivatives at the point (u, v) given by

$$\frac{\partial z}{\partial u} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial u}$$

and

$$\frac{\partial z}{\partial v} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial v}$$

If $x = x(u, v)$, $y = y(u, v)$ and $z = z(u, v)$ have first-order partial derivatives at the point (u, v) , and if the function $w = f(x, y, z)$ is differentiable at the point $(x, y, z) = (x(u, v), y(u, v), z(u, v))$, then

$w = f(x(u, v), y(u, v), z(u, v))$ has first-order partial derivatives at the point (u, v) given by

$$\frac{\partial w}{\partial u} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial u} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial u}$$

and

$$\frac{\partial w}{\partial v} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial v} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial v}$$

Example 36 Given that $z = e^{xy}$, $x = 2u + v$, $y = \frac{u}{v}$, find $\frac{\partial z}{\partial u}$ and $\frac{\partial z}{\partial v}$ using the chain rule.

$$\begin{aligned} \frac{\partial z}{\partial u} &= \frac{\partial z}{\partial x} \cdot \frac{\partial x}{\partial u} + \frac{\partial z}{\partial y} \cdot \frac{\partial y}{\partial u} \\ &= (ye^{xy})(2) + (xe^{xy})\left(\frac{1}{v}\right) \end{aligned}$$

$$\begin{aligned} \frac{\partial z}{\partial v} &= \frac{\partial z}{\partial x} \cdot \frac{\partial x}{\partial v} + \frac{\partial z}{\partial y} \cdot \frac{\partial y}{\partial v} \\ &= (ye^{xy})(1) + (xe^{xy})\left(-\frac{1}{v^2}\right) \end{aligned}$$

#

Example 36 Suppose that $w = e^{xyz}$, $x = 3u + v$, $y = 3u - v$, $z = u^2v$. Use appropriate forms of the

chain rule to find $\frac{\partial w}{\partial u}$ and $\frac{\partial w}{\partial v}$.

$$\begin{aligned} \frac{\partial w}{\partial u} &= \frac{\partial w}{\partial x} \cdot \frac{\partial x}{\partial u} + \frac{\partial w}{\partial y} \cdot \frac{\partial y}{\partial u} + \frac{\partial w}{\partial z} \cdot \frac{\partial z}{\partial u} \\ &= (ye^{xyz})(3) + (xe^{xyz})(3) + (xye^{xyz})(2uv) \end{aligned}$$

$$\frac{\partial w}{\partial v} = \frac{\partial w}{\partial x} \cdot \frac{\partial x}{\partial v} + \frac{\partial w}{\partial y} \cdot \frac{\partial y}{\partial v} + \frac{\partial w}{\partial z} \cdot \frac{\partial z}{\partial v}$$

$$= (ye^{xyz})(1) + (xe^{xyz})(-1) + (xye^{xyz})(u^2) \quad \#$$
